

## Fork Positioners

The fork positioner is actually a hydraulic device which allows the person driving to operate the lift truck without leaving the seat. They are made out of top quality materials and are meant to endure the most demanding operations and work surroundings. Side shifting units have the added ability to laterally position the arms or the entire load so as to facilitate much more precise carrying and position in a faster and much more efficient way.

The only one of its kind fork pocket design enables the person operating it to be able to securely swing the unit's forks without any worry of damaging the positioning cylinders. This allows the operator the option to either perform independent or simultaneous fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into blade positioners on existing units.
